Genetic engineering is also called genetic modification or GM. It involves modifying the genome of an organism by introducing a gene from another organism to result in a desired characteristic...

Genetic engineering - Variation - AQA - GCSE Biology ...
Genetic engineering, also called genetic modification or genetic manipulation, is the direct manipulation of an organism's genes using biotechnology. It is a set of technologies used to change the genetic makeup of cells, including the transfer of genes within and across species boundaries to produce improved or novel organisms.

Genetic engineering - Wikipedia
Genetic engineering, the artificial manipulation, modification, and recombination of DNA or other nucleic acid molecules to modify an organism. The term is generally used to refer specifically to methods of recombinant DNA technology.

genetic engineering | Definition, Process, & Uses | Britannica
Genetic engineering: artificial manipulation and alteration of genes. Process of Genetic Engineering: 1. Isolation Isolation: process of removing DNA from cells. Isolation involves using detergents to break open the cell membranes and nuclear membranes to release the DNA. 2. Cutting and ligation Cutting: removal of a gene from a piece of DNA using a restriction enzyme....
