A projectile with an upward component of motion will have a upward component of acceleration. True or false: As a projectile rises towards the peak of its trajectory, the vertical acceleration will decrease; as it falls from the peak of its trajectory, its vertical acceleration will increase. ... An object that is thrown vertically upward is also a projectile (provided that the influence of air resistance is negligible). And an object which is thrown upward at an angle to the horizontal is also a projectile (provided that the influence of air resistance is negligible). A projectile is any object that once projected or dropped continues in motion by its own inertia and is influenced only by the downward force of gravity.

What is a Projectile? - Physics Classroom

- A projectile with an downward of motion will have a downward component of acceleration. - The magnitude of the vertical velocity of a projectile changes 9.8 m/s each second. - The vertical velocity of a projectile is unaffected by the horizontal velocity; these two components of motion are independent of each other.

Projectile motion is the motion of an object thrown or projected into the air, subject to only the acceleration of gravity. The object is called a projectile, and its path is called its trajectory. The motion of falling objects, as covered in Problem-Solving Basics for One-Dimensional Kinematics, is a simple one-dimensional type of projectile motion in which there is no horizontal movement.
