Until now, we have used the sol-gel technology together with an iterative re-melting and milling step in order to produce rare earth or transition metal doped granular material for the granulated silica method. Here, we present that the iterative re-melting (laser-assisted) and milling step is no longer needed to reach a high homogeneity.

Granulated Silica Method for the Fiber Preform Production

Silica Optical Fiber Technology for Devices and Components also offers a self-contained, menu-driven software program for optical fiber design that simulates waveguide structures for most of the fibers discussed in the book. This software not only enables readers to explore the optical properties of the fibers discussed in the book, it allows them to design and specify their own optical characteristics.

Abstract: The coating of a silica optical fiber with molten tin metal is analyzed rigorously by developing a numerical method based on two- and three-dimensional (2- and 3-D) conduction models. In the analysis, the axial temperature distribution in both the fiber and coating is obtained in terms of the depth the melt and the fiber draw speed. A coating applicator has been designed for tin (Sn) coating and fibers with a coating thickness from 5 to 20 /spl mu/m were fabricated with draw speeds ...

Though silica is still the most cost-efficient material when making fiber-optic technology, new materials bring certain advantages. Besides transporting information, the technology has other practical applications including transmitting electricity. Fiber-optic technology transmits information in pulses of light along specially designed cables.
